Rasch Models and  
Maximum Likelihood (ML) Parameter Estimation

Formosa Robotics Group

Oct. 10, 2021

## Table of Binary Observations $X_{m,n}$ ( $1 \leq m \leq M$ , $1 \leq n \leq N$ ) for $M$ individuals and $N$ items

$X_{m,n}$  is the **Bernoulli (binary, dichotomous)** random variable denoting the response of individual  $m$  with respect to item  $n$ :

$X_{m,n}=1$  if the response is *correct*,  
=0 if the response is **incorrect**.

→item $n$	1	2	3	4	5
↓individual $m$					
1	0	0	1	1	0
2	1	0	1	0	0
3	1	1	1	0	1

$X_{2,3}=1$

$X_{1,5}=0$

$M = 3$  students (individuals), each answering  $N = 5$  problems(items)

# Problem (P1): How to build a simple model for the Probability of Correct Response $p_{m,n}(\theta_m, \lambda_n)$ ?

$p_{m,n}(\theta_m, \lambda_n) = P(X_{m,n} = 1 | \Theta_m = \theta_m, \Lambda_n = \lambda_n)$  is the probability for individual  $m$  to make a **correct** response to item  $n$ , given  $\Theta_m = \theta_m$  and  $\Lambda_n = \lambda_n$ ,  $1 \leq m \leq M$ ,  $1 \leq n \leq N$

- $\Theta_m$  is the random variable denoting the **ability** level of **individual  $m$**
- $\Lambda_n$  is the random variable for the **parameter** of **item  $n$**

		item difficulty $\Lambda_n = \lambda_n$ $n = 3$				
individual ability $\Theta_m = \theta_m$ $m = 2$	→ item $n$ ↓ individual $m$	1	2	3	4	5
	1	$p_{1,1}(\theta_1, \lambda_1)$	$p_{1,2}(\theta_1, \lambda_2)$	$p_{1,3}(\theta_1, \lambda_3)$	$p_{1,4}(\theta_1, \lambda_4)$	$p_{1,5}(\theta_1, \lambda_5)$
	2	$p_{2,1}(\theta_2, \lambda_1)$	$p_{2,2}(\theta_2, \lambda_2)$	$p_{2,3}(\theta_2, \lambda_3)$	$p_{2,4}(\theta_2, \lambda_4)$	$p_{2,5}(\theta_2, \lambda_5)$
	3	$p_{3,1}(\theta_3, \lambda_1)$	$p_{3,2}(\theta_3, \lambda_2)$	$p_{3,3}(\theta_3, \lambda_3)$	$p_{3,4}(\theta_3, \lambda_4)$	$p_{3,5}(\theta_3, \lambda_5)$

$\Theta_m = \theta_m$ : ability level of the  $m$ th student,  $\Lambda_n = \lambda_n$ : difficulty level of the  $n$ th problem

**Answer to (P1):** choose **prototype** of  $p_{m,n}(\theta_m, \lambda_n)$  to be

$$p(\theta, b) = \frac{1}{1 + e^{-D(\theta - b)}}, \quad D \simeq 1.7 \quad (\text{Rasch Model})$$

- Rasch model is a **one-parameter logistic (1PL)** model with individual ability level  $\theta$  and parameter  $b$
- $p(\theta, b)$  is the probability for an individual to make a **correct** response to an item, given ability  $\Theta = \theta$  and difficulty  $\Lambda = b$
- $q(\theta, b) = 1 - p(\theta, b) = \frac{1}{1 + e^{D(\theta - b)}}$  is the probability for an individual to make an **incorrect** response to an item, given  $\Theta = \theta$  and  $\Lambda = b$
- $0 \leq p(\theta, b) \leq 1$ ,  $0 \leq q(\theta, b) \leq 1$  : **valid** probability distributions
- $e$  is Euler's number, a mathematical constant,  $e \simeq 2.71828$ , such that

$$e^t = \frac{d}{dt} e^t = \sum_{k=0}^{\infty} \frac{t^k}{k!}$$

$$\ln(t) = \log_e t, \quad \ln(e^t) = t$$

# Rasch Model (1PL)

$$p(\theta, b) = \frac{1}{1 + e^{-D(\theta - b)}}$$

$$0 \leq p(\theta, b) \leq 1$$

monotonically increasing function of  $\theta$ , for fixed  $b$

R source code for generating ICC

```
1 icc1 <- function(b,D,color) {
2   theta <- seq(-3,3,.1)
3   P1 <- 1/(1+exp(-D*(theta-b)))
4   plot(theta, P1, type="l", xlim=c(-3,3), ylim=c(0,1),
5         xlab="Ability", ylab="Prob(correct response)",
6         col = color)
7 }
8
9 icc2 <- function(b,D,color) {
10  theta <- seq(-3,3,.1)

17 icc2(b=0, D, "green")
18 icc2(b=1, D, "blue")
```

Item Characteristic Curve (ICC)

Rasch model greatly simplifies computations (1)

$$\frac{\partial p}{\partial \theta} = \frac{\partial}{\partial \theta} \frac{1}{1 + e^{-D(\theta - b)}} = \frac{D e^{-D(\theta - b)}}{[1 + e^{-D(\theta - b)}]^2} = Dpq$$

$$p = p(\theta, b)$$

$$q = q(\theta, b) = 1 - p$$

$$\frac{\partial q}{\partial b} = \frac{\partial}{\partial b} \frac{1}{1 + e^{D(\theta - b)}} = \frac{D e^{D(\theta - b)}}{[1 + e^{D(\theta - b)}]^2} = Dpq$$

$$\frac{\partial p}{\partial b} = \frac{\partial}{\partial b} \frac{1}{1 + e^{-D(\theta - b)}} = \frac{-D e^{-D(\theta - b)}}{[1 + e^{-D(\theta - b)}]^2} = -Dpq$$

$$\frac{\partial q}{\partial \theta} = \frac{\partial}{\partial \theta} \frac{1}{1 + e^{D(\theta - b)}} = \frac{-D e^{D(\theta - b)}}{[1 + e^{D(\theta - b)}]^2} = -Dpq$$

$$\frac{\partial p}{\partial \theta} = \frac{\partial q}{\partial b} = Dpq$$

$$\frac{\partial p}{\partial b} = \frac{\partial q}{\partial \theta} = -Dpq$$

$$\frac{d}{dt} \left( \frac{f}{g} \right) = \frac{f'g - g'f}{g^2}$$

## Rasch model greatly simplifies computations (2)

$$\begin{aligned}\frac{\partial}{\partial \theta} \ln(p) &= \frac{\partial}{\partial \theta} \ln\left(\frac{1}{1 + e^{-D(\theta-b)}}\right) = -\frac{\partial}{\partial \theta} \ln(1 + e^{-D(\theta-b)}) \\ &= \frac{-1}{1+e^{-D(\theta-b)}} \frac{\partial}{\partial \theta} (1 + e^{-D(\theta-b)}) = \frac{-D e^{-D(\theta-b)}}{1+e^{-D(\theta-b)}} = Dq = \frac{\partial}{\partial b} \ln(q)\end{aligned}$$

$$\begin{aligned}\frac{\partial}{\partial \theta} \ln(q) &= \frac{\partial}{\partial \theta} \ln\left(\frac{1}{1 + e^{D(\theta-b)}}\right) = -\frac{\partial}{\partial \theta} \ln(1 + e^{D(\theta-b)}) \\ &= \frac{-1}{1+e^{D(\theta-b)}} \frac{\partial}{\partial \theta} (1 + e^{D(\theta-b)}) = \frac{-D e^{D(\theta-b)}}{1+e^{D(\theta-b)}} = -Dp = \frac{\partial}{\partial b} \ln(p)\end{aligned}$$

$$\frac{d}{dt} \ln(g) = \frac{g'}{g}$$

**Problem (P2)** How to estimate 1:  $\Theta_m$  and 2:  $\Lambda_n$ ?

Hint: Use **likelihood** function to find a **good** estimate  $\hat{\theta}_m$  and  $\hat{\lambda}_n$  for the true values of the (**hidden**) variables  $\Theta_m$  and  $\Lambda_n$ .

→item $n$ ↓individual $m$	1	2	3	4	5
1	$p_{1,1}(\theta_1, \lambda_1)$	$p_{1,2}(\theta_1, \lambda_2)$	$p_{1,3}(\theta_1, \lambda_3)$	$p_{1,4}(\theta_1, \lambda_4)$	$p_{1,5}(\theta_1, \lambda_5)$
2	$p_{2,1}(\theta_2, \lambda_1)$	$p_{2,2}(\theta_2, \lambda_2)$	$p_{2,3}(\theta_2, \lambda_3)$	$p_{2,4}(\theta_2, \lambda_4)$	$p_{2,5}(\theta_2, \lambda_5)$
3	$p_{3,1}(\theta_3, \lambda_1)$	$p_{3,2}(\theta_3, \lambda_2)$	$p_{3,3}(\theta_3, \lambda_3)$	$p_{3,4}(\theta_3, \lambda_4)$	$p_{3,5}(\theta_3, \lambda_5)$

$$\hat{\theta}_2 \simeq \theta_2$$

$$\hat{\lambda}_3 \simeq \lambda_3$$

The first step to solve (P2) is to define and find

$$r_{m,n}(x) = P(X_{m,n} = x | \Theta_m = \theta_m, \Lambda_n = \lambda_n), \quad x = 0, 1$$

- For simplicity, abbreviate  $P(X_{m,n} = 1 | \Theta_m = \theta_m, \Lambda_n = \lambda_n)$  as  $p_{m,n}$  and  $q_{m,n} = P(X_{m,n} = 0 | \Theta_m = \theta_m, \Lambda_n = \lambda_n) = 1 - p_{m,n}$
- We have  $r_{m,n}(x) = [p_{m,n}]^x [q_{m,n}]^{1-x}$   
 $= p_{m,n}$  if  $x = 1$  (correct response)  
 $q_{m,n}$  if  $x = 0$  (incorrect response)

**Note:**  $X_{m,n}$  is a binary **random variable**, and  $x_{m,n}$  (or  $x$ ) denotes its **value**: 0 or 1.

## Answer to (P2.1)

Likelihood function of  $\theta_m$ :

$$L_1(\mathbf{x}_m | \theta_m, \boldsymbol{\lambda}) = \prod_{n=1}^N r_{m,n}(x_{m,n})$$

where  $\mathbf{x}_m = (x_{m,1}, x_{m,2}, \dots, x_{m,N})$ ;  $\boldsymbol{\lambda} = (\lambda_1, \dots, \lambda_N)$

**Maximum likelihood (ML) estimate** of  $\theta_m$ , given  $\boldsymbol{\lambda}$ :

$$\hat{\theta}_{m|\boldsymbol{\lambda}} = \arg \max_{\theta_m} \ln L_1(\mathbf{x}_m | \theta_m, \boldsymbol{\lambda})$$

$\ln$ : monotonically increasing function

	Item 1	Item 2	...	Item N
individual $m$	$r_{m,1}(x_{m,1})$	$r_{m,2}(x_{m,2})$	...	$r_{m,N}(x_{m,N})$

$\hat{\theta}_{m|\boldsymbol{\lambda}}$

## Answer to (P2.2)

Likelihood function of  $\lambda_n$ :

$$L_2(\mathbf{x}_{,n}|\lambda_n, \boldsymbol{\theta}) = \prod_{m=1}^M r_{m,n}(x_{m,n})$$

where  $\mathbf{x}_{,n} = (x_{1,n}, x_{2,n}, \dots, x_{M,n})$ ;  $\boldsymbol{\theta} = (\theta_1, \dots, \theta_M)$

Item  $n$

$r_{1,n}(x_{1,n})$

$r_{M,n}(x_{M,n})$

$\hat{\lambda}_{n|\boldsymbol{\theta}}$

**Maximum likelihood (ML) estimate** of  $\lambda_n$ , given  $\boldsymbol{\theta}$ :

$$\hat{\lambda}_{n|\boldsymbol{\theta}} = \arg \max_{\lambda_n} \ln L_2(\mathbf{x}_{,n}|\lambda_n, \boldsymbol{\theta})$$

Since  $\ln(t) = \log_e t$  is a monotonically increasing function of  $t$ ,

$$\arg \max_{\lambda_n} L_2(\mathbf{x}_{,n}|\lambda_n, \boldsymbol{\theta}) = \arg \max_{\lambda_n} \ln L_2(\mathbf{x}_{,n}|\lambda_n, \boldsymbol{\theta})$$

## ML Estimates of Individual Ability $\hat{\theta}_{m|\lambda}$ (1)

$$\ln L_1(\mathbf{x}_m|\theta_m, \lambda) = \sum_{n=1}^N \ln r_{m,n}(x_{m,n})$$

$$\frac{\partial}{\partial \theta_m} \ln r_{m,n}(x_{m,n}) = \frac{\partial}{\partial \theta_m} [x_{m,n} \ln(p_{m,n}) + (1 - x_{m,n}) \ln(q_{m,n})]$$

$$\frac{\partial}{\partial \theta_m} \ln(p_{m,n}) = \frac{\partial}{\partial \theta_m} \ln\left(\frac{1}{1 + e^{-D(\theta_m - b_n)}}\right) = \frac{D e^{-D(\theta_m - b_n)}}{1 + e^{-D(\theta_m - b_n)}} = D q_{m,n} = D(1 - p_{m,n})$$

From Rasch Model

$$\frac{\partial}{\partial \theta_m} \ln(q_{m,n}) = \frac{\partial}{\partial \theta_m} \ln\left(\frac{1}{1 + e^{D(\theta_m - b_n)}}\right) = \frac{-D e^{D(\theta_m - b_n)}}{1 + e^{D(\theta_m - b_n)}} = -D p_{m,n}$$

$$\frac{\partial}{\partial \theta_m} \ln r_{m,n}(x_{m,n}) = D x_{m,n} (1 - p_{m,n}) - D (1 - x_{m,n}) p_{m,n} = D (x_{m,n} - p_{m,n})$$

$$\frac{\partial}{\partial \theta_m} \ln L_1(\mathbf{x}_m|\theta_m, \lambda) = D \sum_{n=1}^N (x_{m,n} - p_{m,n})$$

$$p_{m,n} = \frac{1}{1 + e^{-D(\theta_m - b_n)}}$$

From Rasch Model

# ML Estimates of Individual Ability $\hat{\theta}_{m|\lambda}$ (2)

**Newton-Raphson Method** for root-finding:

The root  $x^*$  satisfying  $f(t^*) = 0$  can be found by iterating

$$t_{k+1} = t_k - \frac{f(t_k)}{f'(t_k)}, \quad k = 0, 1, 2, 3 \dots \text{ until convergence.}$$

usually, very fast convergence

Maximum likelihood solution  $\hat{\theta}_{m|\lambda} = \arg \max_{\theta_m} \ln L_1(\mathbf{x}_m, |\theta_m, \lambda)$

occurs when  $\frac{\partial}{\partial \theta_m} \ln L_1(\mathbf{x}_m, |\theta_m, \lambda) = 0$

Newton-Raphson iteration  
 $t = \theta_m$

for the ML ability estimate of  $\theta_m$   
 $m = 1, \dots, M$

$$f(\theta_m) = \frac{\partial}{\partial \theta_m} \ln L_1(\mathbf{x}_m, |\theta_m, \lambda) = D \sum_{n=1}^N (x_{m,n} - p_{m,n})$$

$$f'(\theta_m) = \frac{\partial^2}{\partial \theta_m^2} \ln L_1(\mathbf{x}_m, |\theta_m, \lambda) = -D^2 \sum_{n=1}^N p_{m,n} q_{m,n}$$

# ML Estimates of Item Parameters $\hat{\lambda}_{n|\theta}$ (1)

**Maximum likelihood (ML) estimate** of  $\lambda_n$ , given  $\theta$ :

$$\hat{\lambda}_{n|\theta} = \arg \max_{\lambda_n} \ln L_2(\mathbf{x}_n, |\lambda_n, \theta)$$

$$\frac{\partial}{\partial \lambda_n} \ln L_2(\mathbf{x}_n, |\lambda_n, \theta) = \frac{\partial}{\partial \lambda_n} \sum_{m=1}^M [x_{m,n} \ln(p_{m,n}) + (1 - x_{m,n}) \ln(q_{m,n})]$$

$$\text{Rasch model: } \lambda_n = b_n, \quad p_{m,n} = \frac{1}{1 + e^{-D(\theta_m - b_n)}}$$

$$\frac{\partial}{\partial b_n} \ln(p_{m,n}) = \frac{\partial}{\partial b_n} \ln\left(\frac{1}{1 + e^{-D(\theta_m - b_n)}}\right) = \frac{-D e^{-D(\theta_m - b_n)}}{1 + e^{-D(\theta_m - b_n)}} = -D q_{m,n} = D(p_{m,n} - 1)$$

$$\frac{\partial}{\partial b_n} \ln(q_{m,n}) = \frac{\partial}{\partial b_n} \ln\left(\frac{1}{1 + e^{D(\theta_m - b_n)}}\right) = \frac{D e^{D(\theta_m - b_n)}}{1 + e^{D(\theta_m - b_n)}} = D p_{m,n}$$

$$\Rightarrow \frac{\partial}{\partial \lambda_n} \ln L_2(\mathbf{x}_n, |\lambda_n, \theta) = \sum_{m=1}^M D [x_{m,n}(p_{m,n} - 1) + (1 - x_{m,n})p_{m,n}] = D \sum_{m=1}^M (p_{m,n} - x_{m,n})$$

# ML Estimates of Item Parameters $\hat{\lambda}_{n|\theta}$ (2)

Apply Newton-Raphson iteration with

$$g(\lambda_n) = \frac{\partial}{\partial \lambda_n} \ln L_2(\mathbf{x}_n | \lambda_n, \boldsymbol{\theta}) = D \sum_{m=1}^M (p_{m,n} - x_{m,n})$$

$$g'(\lambda_n) = \frac{\partial^2}{\partial \lambda_n^2} \ln L_2(\mathbf{x}_n | \lambda_n, \boldsymbol{\theta}) = D^2 \sum_{m=1}^M p_{m,n} q_{m,n}$$

$$\lambda_{n,k+1} = \lambda_{n,k} - \frac{g(\lambda_{n,k})}{g'(\lambda_{n,k})}, \quad k = 0, 1, 2, 3 \dots$$

to find  $\hat{\lambda}_{n|\theta} = \lambda_{n,\infty} = \arg \max_{\lambda_n} \ln L_2(\mathbf{x}_n | \lambda_n, \boldsymbol{\theta}) \quad n = 1, \dots, N$

for the maximum likelihood (ML) parameter estimate of  $b_n$  (Rasch model, 1PL)

## R source code for ML estimation of individual **ability**

```

1 ability <- function(x, b) {
2   D <- 1.7
3   D2 <- D * D
4   N <- length(b)
5   MaxCnt <- 50
6   theta <- 1.
7   Tiny <- 0.001
8   for (i in 1:MaxCnt) {
9     numerator <- 0
10    denominator <- 0
11    for (n in 1:N) {
12      p <- 1/(1+exp(-D*(theta-b[n])))
13      numerator <- numerator + D * (x[n] - p)
14      denominator <- denominator + D2 * p * (1-p)
15    }
16    diff <- numerator / denominator
17    theta <- theta - diff
18    cat(paste("[", i, "] ability =", theta, " diff=", diff, "\n")); flush.console()
19    if (abs(diff) < Tiny) break
20  }
21 }
22
23
24 b <- c(0.5, -0.5, 0.7, 0.6, -1, 0.9, 0, -0.5, 0) # difficulty level
25 x <- c(1, 0, 1, 1, 0, 1, 0, 1, 0) # individual responses, #individuals M = 1
26 ability(x,b)

```

$p_{m,n} = \frac{1}{1 + e^{-D(\theta_m - b_n)}}$

$f(\theta_m) = D \sum_{n=1}^N (x_{m,n} - p_{m,n})$

$f'(\theta_m) = -D^2 \sum_{n=1}^N p_{m,n} q_{m,n}$

$t_{k+1} = t_k - \frac{f(t_k)}{f'(t_k)}$

ability = 0.255586, convergence in 3 steps

## Brief Review for Clarity (1)

A total of  $(M+N)$  hidden parameters  $\boldsymbol{\theta} = (\theta_1, \dots, \theta_M)$  and  $\boldsymbol{\lambda} = (\lambda_1, \dots, \lambda_N)$  are to be estimated and extracted from the  $M \times N$  input data matrix  $[x_{m,n}]$ .

Column- $n$ : item difficulty  $\lambda_n = b_n$

Row- $m$ :  
ability  
 $\theta_m$

→item $n$ ↓individual $m$	$\lambda_1$	...	$\lambda_n$	...	$\lambda_N$
$\theta_1$	$x_{1,1}$	...	$x_{1,n}$	...	$x_{1,N}$
.	.	...	.	...	.
.	.	...	.	...	.
$\theta_m$	$x_{m,1}$	...	$x_{m,n}$	...	$x_{m,N}$
.	.	...	.	...	.
.	.	...	.	...	.
$\theta_M$	$x_{M,1}$	...	$x_{M,n}$	...	$x_{M,N}$

Input data  $x_{m,n} = 0,1$

## Brief Review for Clarity (2)

Maximum Likelihood (ML) estimates of individual ability levels and item difficulty levels, respectively, are calculated efficiently by aggregating horizontally and vertically along the matrix.

→item $n$ ↓individual $m$	$\lambda_1$	...	$\lambda_n$	...	$\lambda_N$
$\theta_1$	$r_{1,1}(x_{1,1})$	...	$r_{1,n}(x_{1,n})$	...	$r_{1,N}(x_{1,N})$
.	.	...	.	...	.
.	.	...	.	...	.
$\theta_m$	$r_{m,1}(x_{m,1})$	...	$r_{m,n}(x_{m,n})$	...	$r_{m,N}(x_{m,N})$
.	.	...	.	...	.
.	.	...	.	...	.
$\theta_M$	$r_{M,1}(x_{M,1})$	...	$r_{M,n}(x_{M,n})$	...	$r_{M,N}(x_{M,N})$

$\hat{\lambda}_n | \boldsymbol{\theta}$

Rasch model:  $p_{m,n} = \frac{1}{1+e^{-D(\theta_m - b_n)}} = 1 - q_{m,n}$   
depends only on  $\theta_m$  and  $b_n$ , so does  $r_{m,n}(x)$ , given  $x$ .

$$r_{m,n}(x) = [p_{m,n}]^x [q_{m,n}]^{1-x}, \quad x_{m,n} = x \in \{0,1\}$$

# Conclusions

- We formulate the maximum likelihood (ML) estimates of individual ability and item parameters for IRT using Rasch model (1PL).
- R programs are developed to verify the validity of the Rasch model and ML estimate of individual ability  $\theta_m$ .
- Newton-Raphson iteration method results in very fast convergence in computing the ML estimate of  $\theta_m$ , usually  $< 10$  steps.
- We reformulate the mathematical derivation of formulas in [1] to provide a succinct representation of basic IRT theory.
- We modify the simple R programs in [2] to yield our R source codes.
- Our analysis paves the way to Bayesian and Neural Networks.
